The past few months have mostly consisted of selling electronics on eBay. More specifically, RAMPS 1.4 sets with the Arduino Mega 2560 R3 board, power supply, and USB cable. We still need more funding to keep more inventory on hand and operate an actual store. We have been working on setting up a kickstart project on <http://kickstarter.com>. It looks to be a good way to do a nice project like getting the final model in order as well as tutorials done. I have a great project in mind that will get a few more RepRaps out there as well as a few more cool kits. Hopefully it goes well, I have faith that it will though.

The website is completely switched over into our new theme and called "Gala Automation Systems." A bit more tweaking is needed, but things are starting to come together. We still need to take a lot of pictures for the future web store, not to mention all the cropping, resizing, and adding of borders. We need to order more parts (rods and bearings) to shoot the next portion of our tutorials. The electronics footage hasn't been looked at, but we are certain it needs to be reshot. We are going to be making the tutorials as part of the kickstarter project. We will get a microphone and another camera to make the tutorials.

Lots of great ideas flowing. The process and future plans are essentially in place. Just kind of need inventory :)
